
Supplier Quality Audit Report

Nordic Components Oy

Quarterly supplier-control audit for Q2 2026

Audit date	18 June 2026
Audit reference	PQT-NC-2026-Q2-018
Audit scope	Incoming inspection, measurement control, corrective actions, shipment labelling, and delivery-quality coordination
Audit score	72 / 100
Overall status	Conditional - corrective action required
Audit team	Procurement Quality Team
Distribution	Procurement manager, procurement analyst, category owner, and supplier quality contact

Executive conclusion

Nordic Components achieved an audit score of 72 / 100. The score is below the procurement quality threshold for unrestricted supplier status. Two major nonconformities and one minor nonconformity require corrective action. The supplier remains active under conditional monitoring.

Unrestricted status may be restored only after the corrective-action plan is accepted, the actions are verified, and the follow-up audit score is at least 85 / 100.

1. Audit purpose, scope, and method

1.1 Purpose

The audit evaluated whether Nordic Components' controls provide reliable incoming-quality evidence, timely corrective-action closure, traceable shipment labelling, and adequate coordination between supplier quality and delivery performance. This report is a synthetic UC04 evaluation fixture and contains no personal data.

1.2 Scope

- Incoming-inspection records for Q2 2026 receipts.
- Calibration status and supporting records for gauges used in incoming inspection.
- Corrective-action tracking, including CAPA-17.
- Packaging and batch-labelling controls for sampled shipments.
- Interfaces between supplier corrective actions, procurement monitoring, and follow-up audit decisions.

1.3 Evidence sample

Evidence set	Sample size	Selection basis	Audit use
Incoming-inspection gauges	10 gauges	Gauges used for sampled Q2 receipts	Verify calibration-record completeness
Corrective-action files	CAPA-17 plus supporting tracker	Open and recently due items	Verify due-date control and closure evidence
Shipment labels	20 shipments	Q2 receipts across three product families	Verify batch-number traceability
Receiving and incident records	Q2 supplier records	Quarterly monitoring set	Relate quality findings to operational monitoring

1.4 Method

The team reviewed documented controls, sampled records, compared due dates with closure evidence, and checked whether shipment traceability could be reconstructed. Findings were classified as major when a control failure could materially weaken inspection reliability or corrective-action governance. The packaging-label issue was classified as minor because traceability could still be reconstructed from dispatch records.

2. Audit scorecard

The following category scores form the total audit score of 72 / 100.

Control area	Score	Maximum	Key evidence	Assessment
Incoming inspection	18	25	Inspection records and sampled receipt files	Process operating, but record completeness depends on measurement-control evidence
Calibration control	12	20	10 sampled gauges	Records missing for 4 of 10 sampled gauges
Corrective-action governance	10	20	CAPA-17 and action tracker	CAPA-17 overdue from 31 May 2026
Shipment traceability	14	15	20 sampled shipment labels	3 labels lacked a batch number; traceability reconstructed
Delivery-quality coordination	18	20	Receiving, escalation, and monitoring records	Conditional monitoring is active and escalation path is defined
Total	72	100	All audit evidence	Conditional - corrective action required

Score interpretation

Score range	Status	Interpretation
85-100	Unrestricted	Controls are adequate; routine monitoring applies
70-84	Conditional	Corrective action and verification are required
Below 70	Restricted review	Procurement management escalation is required before further sourcing decisions

Nordic Components falls in the Conditional range. The score alone does not close the findings. Each required action must be supported by acceptable evidence and verified during the follow-up process.

3. Detailed findings

3.1 NC-01 - Incomplete calibration records

Classification	Major nonconformity
Requirement	Measurement equipment used for incoming inspection must have current, retrievable calibration evidence.
Evidence	Calibration records were missing for 4 of 10 sampled gauges.
Risk	Inspection results cannot be fully demonstrated as reliable when measurement status is not documented.
Required response	Identify affected gauges, provide valid records or remove the gauges from use, and assess whether affected inspections require review.

3.2 NC-02 - Overdue corrective action CAPA-17

Classification	Major nonconformity
Requirement	Corrective actions must be completed or formally extended with documented justification before the due date.
Evidence	CAPA-17 remained open and was overdue from 31 May 2026.
Risk	An overdue action can allow a known control weakness to continue without verified containment or closure.
Required response	Provide current containment, root-cause evidence, completed actions, effectiveness criteria, and a controlled closure record.

3.3 Minor nonconformity - Packaging-label traceability

Three of 20 reviewed shipments used packaging labels without a batch number. Dispatch records allowed traceability to be reconstructed, so the issue was classified as minor. The corrective-action plan must still address label-generation control, verification before dispatch, and evidence that the revised control is operating.

4. Risk, impact, and audit conclusion

4.1 Risk assessment

Finding	Potential impact	Current control	Residual concern
NC-01	Unreliable or unverifiable incoming-inspection results	Additional review of inspection records	Calibration evidence is incomplete for sampled gauges
NC-02	Known weakness remains open beyond its planned closure	Conditional supplier monitoring	CAPA-17 effectiveness is not yet verified
Packaging labels	Reduced batch traceability during containment or investigation	Dispatch records can reconstruct traceability	Label control must prevent recurrence

4.2 Procurement implications

- Nordic Components remains an active supplier under conditional monitoring.
- Order volume must not be increased until the corrective-action plan is accepted and the follow-up audit score is at least 85 / 100.
- Procurement Quality Team must verify action evidence before unrestricted status is restored.
- The audit does not by itself authorize supplier rejection, contract termination, or a volume transfer to another supplier.

4.3 Audit conclusion

The score of 72 / 100 does not meet the procurement quality threshold for unrestricted status. The missing calibration records and overdue CAPA-17 are major control weaknesses. The packaging-label issue is narrower, but it still requires prevention of recurrence. Nordic Components must remain under conditional monitoring until the corrective actions are accepted and verified.

The follow-up audit is scheduled for 20 August 2026. A score of at least 85 / 100 is required, together with verified corrective-action evidence, before unrestricted status may be restored.

5. Corrective actions and verification

Action	Owner	Due date	Required evidence	Verification
Submit a corrective-action plan covering NC-01, NC-02, and the packaging-label issue	Nordic Components	15 July 2026	Root cause, containment, actions, owners, dates, and effectiveness criteria	Procurement Quality Team reviews and accepts the plan
Restore or replace missing calibration evidence and assess affected inspections	Nordic Components	15 July 2026	Gauge list, valid certificates or withdrawal records, and impact assessment	Sample check against equipment and inspection records
Complete and close CAPA-17 with effectiveness evidence	Nordic Components	15 July 2026	Completed action record, closure approval, and effectiveness evidence	Trace CAPA-17 from overdue status to controlled closure
Correct packaging-label control	Nordic Components	15 July 2026	Revised label control and sample labels containing batch numbers	Review labels during follow-up sampling
Complete follow-up supplier audit	Procurement Quality Team	20 August 2026	Follow-up report, finding status, and score	At least 85 / 100 plus verified actions is required

Decision rule

Unrestricted status may be restored only after the corrective-action plan is accepted, the actions are verified, and the follow-up audit score is at least 85 / 100.

Document control

Field	Value
Document reference	PQT-NC-2026-Q2-018
Version	1.1 - detailed synthetic evaluation fixture
Evidence period	Q2 2026
Prepared by	Procurement Quality Team
Confidentiality	Internal procurement information; synthetic and non-personal
Approval status	Audit report issued; supplier corrective action remains open
